Salesforce Theoretical Project

PREPARED BY

Nedelcu Radu-Andrei

Company Overview

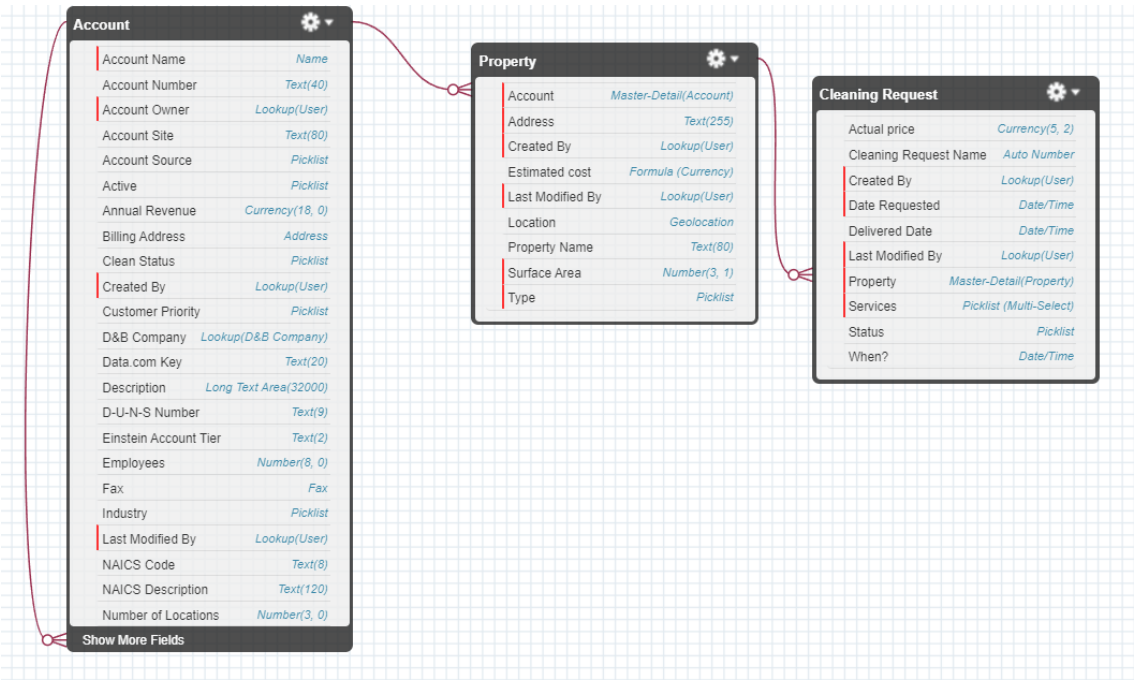
As a cleaning startup, SpecialClean knows how valuable your personal time is - definitely worth more than using it to scrub toilets and better utilised to catch up with friends, pursue a hobby or spend a nice evening with your family.

In order to follow this belief, SpecialClean wants to use Salesforce to improve and innovate the customer's experience, offering them frictionless, easy ways to schedule services and estimate costs.

Used SF Cloud

Being on top of you customers' experience (not only when converting them from leads, but also when they become regulars) means having as much data as possible about them (even from social media) and keeping it organized, relevant & updated. Thus, SpecialClean would benefit the most from using the Sales Cloud.

Data Model



1. Property

Object used to describe the location that needs cleaning.

Fields:

- Property Name - text, self-explanatory
- Address - Text (so the cleaning team honoring the request knows where to actually go) (required)
- Surface Area & Type of the building (school, house, flat etc), so we can give a rough estimate of the price, useful both for the client to set expectations and for the company itself. (required)

2. Cleaning Request

Object used to describe the exact services requested.

Fields:

- Date Requested - Date Time, when was the request placed, required, set automatically
- When? - Date Time, the date scheduled by the client, required
- Delivered Date - Date Time, the date when the request was fulfilled. (Set automatically when the status is changed to “Done”)
- Status - Picklist, the status of the request, ranging from Pending (when the customer placed the request but it was not yet handled to any team), Confirmed (a team got the request), In Progress, and Done. (required, default pending)
- Services - MultiSelect, the services requested by the client so the team can come prepared (required)

3. Relationships between the objects

As shown in the figure, an Account can have multiple properties and a property can have multiple cleaning requests.

4. Validation Rules

1. As a startup, SpecialClean’s area of service is still limited. So, Property’s location cannot be more than 10km away from Bucharest.
2. Property’s surface area cannot be negative (by definition)
3. Cleaning request’s “When?” must be after “Date Requested”.
4. Cleaning “Delivered Date” must be bigger or equal to “Date Requested”
5. “Delivered Date” can only be set when the status is “Done”

Security Model

1. Profiles

a. Sales Rep - Person interacting with customers

	Basic Access				Data Administration	
	Read	Create	Edit	Delete	View All	Modify All
Cleaning Requests	☑	☑	☑	☑	☑	☑
Cleaning Teams	☑	☐	☐	☐	☑	☐

	Basic Access				Data Administration	
	Read	Create	Edit	Delete	View All	Modify All
Properties	☑	☑	☑	☑	☑	☑

- Full access to the cleaning requests & properties so he can fulfill any potential need of the customer (such as deleting an old property or create a new cleaning request)
- Can see all teams in order to have an overview on how busy they are

b. Sector Manager - Person in charge of the teams within a sector

	Basic Access				Data Administration	
	Read	Create	Edit	Delete	View All	Modify All
Cleaning Requests	☑	☐	☑	☑	☐	☐
Cleaning Teams	☑	☑	☑	☑	☐	☐

	Basic Access				Data Administration	
	Read	Create	Edit	Delete	View All	Modify All
Properties	☑	☑	☑	☑	☐	☐

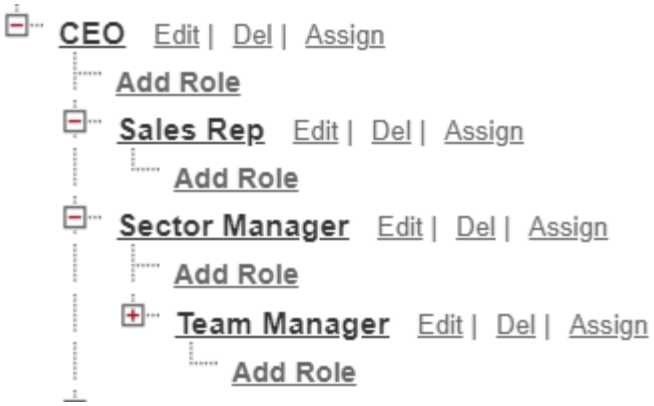
c. Team Manager - Person in charge of a cleaning team

	Basic Access				Data Administration	
	Read	Create	Edit	Delete	View All	Modify All
Cleaning Requests	☑	☐	☑	☐	☐	☐
Cleaning Teams	☑	☐	☐	☐	☐	☐

	Basic Access				Data Administration	
	Read	Create	Edit	Delete	View All	Modify All
Properties	☑	☐	☐	☐	☐	☐

- Can only edit the status field of “Cleaning Requests”

2. Roles

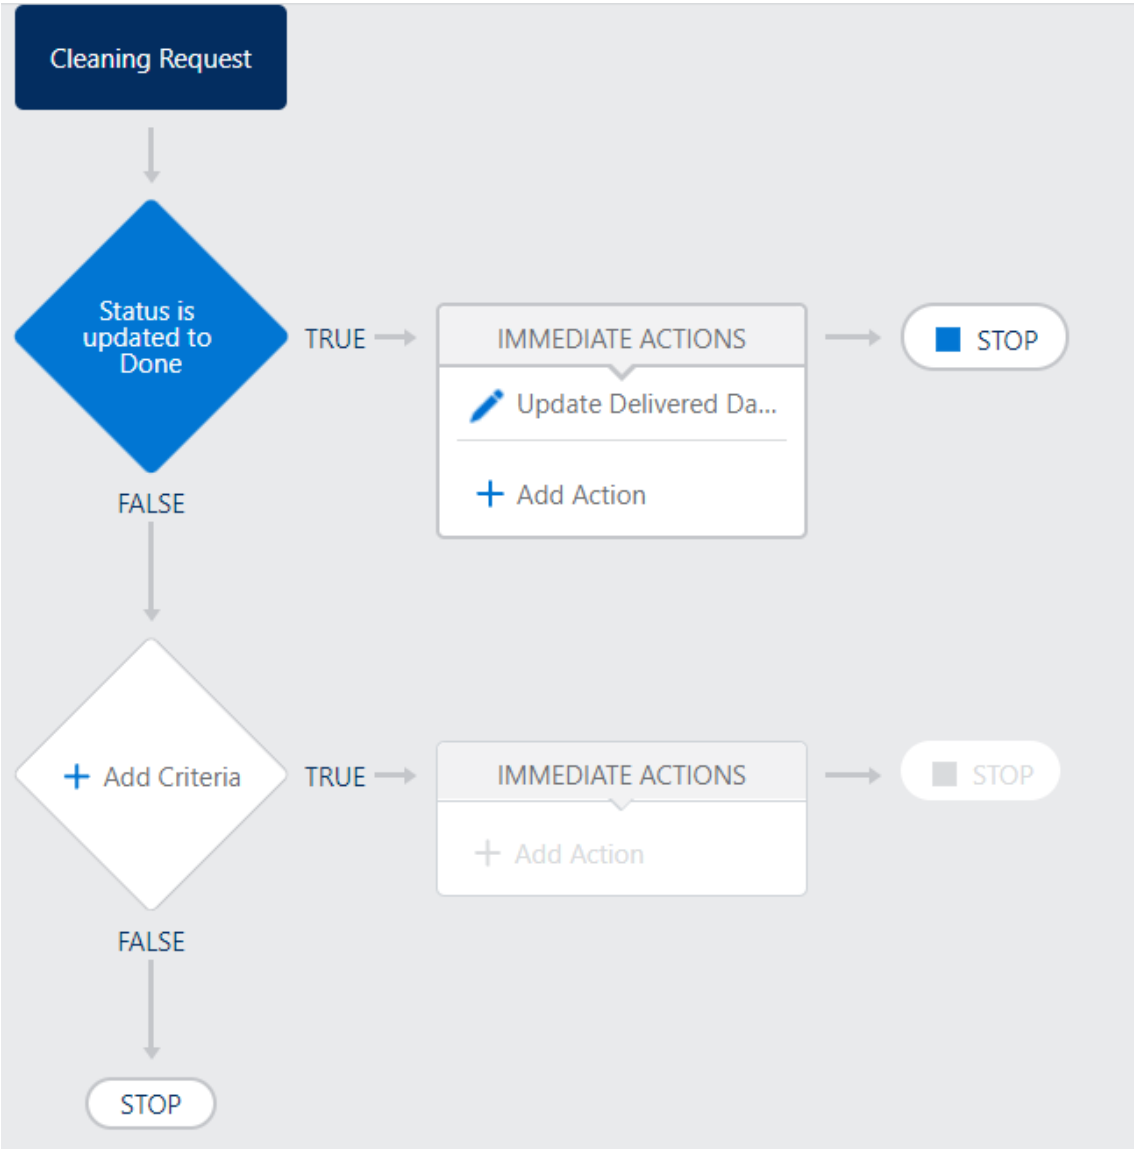


3. Organization Wide Defaults

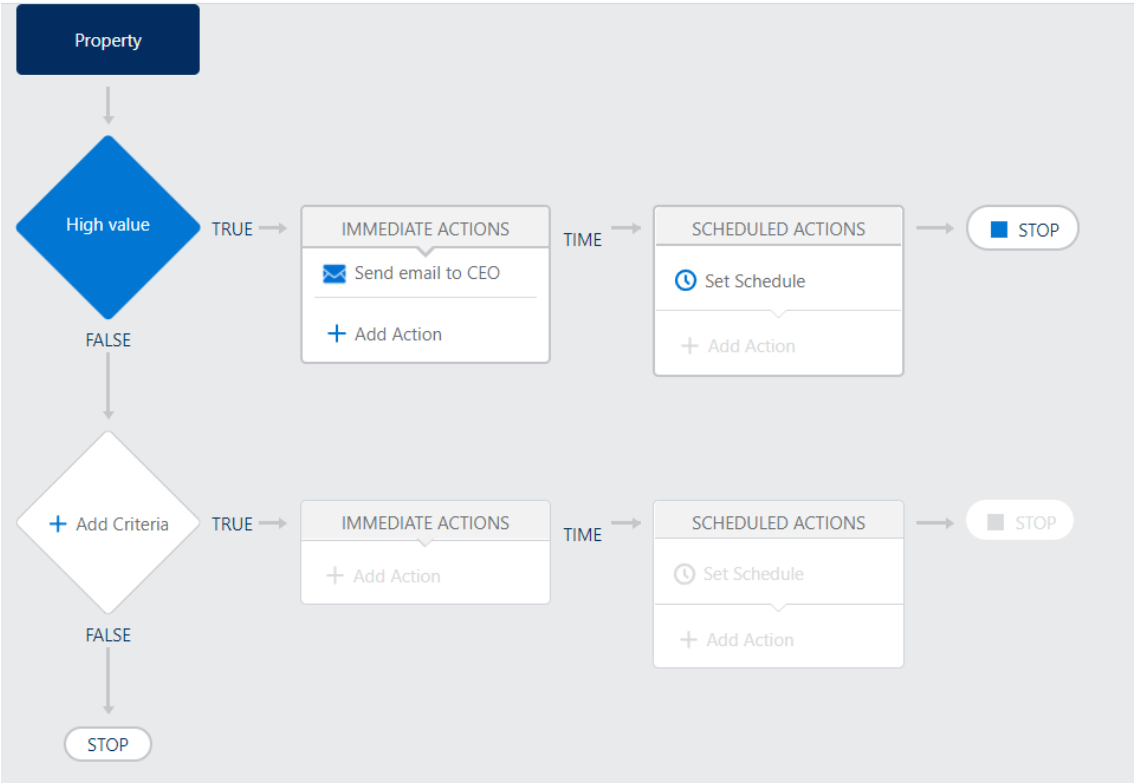
- public read only on accounts

Process Automation

1. Automatically set "Delivered Date" when the Cleaning Request's status is changed to "Done"



2. When a property with a high estimated cost is created, send an email to the CEO



Custom Code Automation & Integration

1. When a property is created (before insert), use Google Maps API to get coordinates and check if it's within 10km of Bucharest

https://developers.google.com/maps/documentation/geocoding/overview (to transform address into coordinates)

https://developers.google.com/maps/documentation/distance-matrix/overview (to calculate distance)

In order to secure the API credentials, we can use one Named Credential for each API.

2. Get a daily reminder with the cleaning requests whose dates are about to expire.

We can get this functionality by using a "batchable" class that will handle the logic of finding the required cleaning requests and inserting the FeedItems. This class will be called every night using a "schedulable" class.

Lighting Web Components

SpecialClean can use LWC in order to make cleaning teams' jobs easier: display in the same mobile screen the most important job details (such as services requested and equipment needed) and show the optimal route from the current location to the property by integrating with the Google Directions API.
